Cover letter

Dear Editor-in-Chief,

We are pleased to resubmit our revised manuscript entitled “Your Manuscript Title Goes Here” (Manuscript ID: JOURNAL-YYYY-NN-NNNN (optional submission ID)) for further consideration. We sincerely thank the Editor and the reviewers for their constructive feedback. The enclosed response letter addresses each comment point-by-point; below we summarize the study and the principal revisions.

[Placeholder — replace with a brief summary of your work, motivation, and scope.]

Summary of revisions. **[Placeholder — list the main changes made in response to the reviewers, e.g. new experiments, clarified methodology, expanded literature review.]**

We believe this manuscript aligns with the scope of the target journal. The manuscript has not been submitted elsewhere, and there are no conflicts of interest.

Thank you for considering our paper. We welcome further feedback from the editorial team and reviewers.

Sincerely,

<https://www.overleaf.com/read/pymfgmnhtmbqe5f83a>

Reviewer 1

Comment 1.1

[Placeholder reviewer comment.] The manuscript does not sufficiently discuss the computational cost of the proposed method. Please add an analysis comparing runtime, memory, or API usage against baselines.

Author response

[Placeholder author response.] Thank you for raising this concern. We have added a new subsection and Fig. ?? comparing computational cost across methods.

Changes in the manuscript

[Section III.A: Computational Analysis]

[Placeholder manuscript excerpt.] We compare training time, inference latency, and overall cost under two settings. The proposed method achieves lower overhead than prior approaches while maintaining comparable accuracy.

(Cont.)

A

Placeholder figure — replace `img/fig-A.pdf`

600 × 800

Figure 1: Placeholder figure A — replace with your cost or runtime comparison.

Comments 1.2 & 1.3

Comment 1.2. [Placeholder.] The experimental setup for dataset splitting is unclear. Please describe train/validation/test splits and any stratification.

Comment 1.3. [Placeholder.] Reproducibility details (hyperparameters, random seeds, hardware) should be reported more fully.

Author response

Regarding Comment 1.2. [Placeholder author response.] We have expanded Section IV with a table summarizing dataset splits and stratification procedures [0].

Regarding Comment 1.3. [Placeholder author response.] We added implementation details, hyperparameter settings, and hardware specifications to the revised manuscript. Code will be released upon acceptance.

Changes in the manuscript**[Section IV.A: Experimental Setup]**

[Placeholder manuscript excerpt.] Table ?? summarizes the datasets and split sizes. All experiments use fixed random seeds and the same hardware configuration.

Table 2: Placeholder dataset summary — replace with your data.

Dataset	Split (train / val / test)	Description
Dataset A	1000 / 200 / 200	Placeholder description.
Dataset B	5000 / 1000 / 1000	Placeholder description.

Comment 1.4

[Placeholder reviewer comment.] The paper should compare against additional baselines from recent literature to strengthen the empirical evaluation.

Author response

[Placeholder author response.] We agree and have added comparisons to two recent methods [0]. Results are summarized in Fig. ??.

Changes in the manuscript

[Section IV.B: Baseline Comparison]

[Placeholder manuscript excerpt.] Fig. ?? shows balanced accuracy across methods. Our approach remains competitive or superior on most metrics.

Reviewer 2

Comment 2.1

[Placeholder summary comment.] This paper proposes a novel framework for [task]. The motivation is clear, the methodology is interesting, and the experiments on standard benchmarks suggest the approach is effective. I summarize the main points above and raise detailed questions below.

Author response

[Placeholder author response.] We thank the reviewer for this accurate summary of our work. We address the detailed technical points in the comments below.

Comment 2.2

[Placeholder reviewer comment.] The theoretical justification for the core alignment mechanism is weak. Please temper claims or provide stronger empirical support.

Author response

[Placeholder author response.] We agree that we do not claim formal theoretical guarantees. We revised the manuscript to describe alignment as improving cross-domain *representation generalization* rather than preserving intrinsic semantic structure. We added ablations in Fig. ?? and expanded the discussion in Section III.B.

Changes in the manuscript**[Section III.B: Method]**

[Placeholder manuscript excerpt.] Fig. ?? illustrates the proposed architecture. We now explicitly state that harmonization improves empirical generalization without claiming construct equivalence.

(Cont.)

D

Placeholder figure — replace `img/fig-D.pdf`

600 × 800

Figure 5: Placeholder figure D — replace with your ablation results.

Comments 2.3 & 2.4

Comment 2.3. [Placeholder.] More backbone models should be evaluated for the auxiliary module (e.g. different LLM families).

Comment 2.4. [Placeholder.] Parameter-efficient fine-tuning baselines (e.g. LoRA, adapters) should be included where applicable.

Author response

Regarding Comment 2.3. [Placeholder author response.] We extended experiments to three additional backbones; see Fig. ??.

Regarding Comment 2.4. [Placeholder author response.] We added QLoRA fine-tuning as a supplementary baseline [0]. Gains were modest relative to cost; we discuss this in Section IV.C.

Changes in the manuscript

[Section IV.C: Extended Model Comparison]

[Placeholder manuscript excerpt.] Fig. ?? compares performance under varying hyperparameter settings across model families.

Figure 6: Placeholder figures E & F (side-by-side subfigures) — replace with your multi-model comparison.

References for this section

- [0] C. Author and D. Author. “A Placeholder Method for Benchmark Tasks”. In: *Proceedings of the Placeholder Conference*. 2025, pp. 100–110.

Comment 2.5

[Placeholder reviewer comment.] Sensitivity analysis for the joint loss and its hyperparameters is insufficient. Please report ablations in more detail.

Author response

[Placeholder author response.] We restructured Section IV to separate baseline establishment, component ablation, and hyperparameter sensitivity. Table ?? lists the configurations; full results appear in the revised manuscript.

Changes in the manuscript

[Section IV.D: Hyperparameter Sensitivity]

[Placeholder manuscript excerpt.] We evaluate a discrete grid over key coefficients. The weight on ambiguous samples has negligible effect; the weight on rejected samples is more dataset-dependent.

Table 7: Placeholder hyperparameter configurations — replace with your settings.

Notation	Description
α	Placeholder coefficient for term A.
β	Placeholder coefficient for term B.
γ	Placeholder coefficient for term C.

Reviewer 3

Comment 3.1

[Placeholder summary comment.] The topic is timely and relevant. Strengths include: (1) addressing an important practical challenge; (2) a promising use of foundation models; (3) competitive experimental results on standard benchmarks.

Author response

[Placeholder author response.] We thank the reviewer for the positive assessment and for highlighting the strengths of our work. We hope the revisions described below address the remaining concerns.

Comment 3.2

[Placeholder reviewer comment.] The central claim of the paper is not sufficiently grounded in the literature review. Related work should discuss [topic] more systematically.

Author response

[Placeholder author response.] Thank you for this observation. We substantially revised Section 2 to define our terminology, contrast prior theory-dependent approaches with theory-agnostic goals, and cite representative recent work [0].

Changes in the manuscript**[Section II: Related Work]**

[Placeholder manuscript excerpt.] We added a dedicated subsection discussing prior approaches from both algorithmic and conceptual perspectives. We clarify how our contribution differs from single-dataset or single-framework methods.

(... contents omitted; see revised manuscript)

Comment 3.3

[Placeholder reviewer comment.] The literature review cites several prior studies without explaining how they relate to or motivate the proposed framework. This may confuse readers about the paper's positioning.

Author response

[Placeholder author response.] We revised Section 2 to explicitly connect each cited family of methods to a limitation that motivates our design: fragmented datasets, theory dependence, deployment cost, or data leakage. We do not dismiss prior work; we use it to motivate our encoder-first, modular design described in Section 3.

Changes in the manuscript

[Section II.B: Prior Work]

[Placeholder manuscript excerpt.] Each paragraph now ends with a sentence linking the cited work to a gap addressed by our method.

[Section II.C: Positioning]

[Placeholder manuscript excerpt.] We state clearly that our contribution is methodological and empirical validation under heterogeneous settings, not a new psychological theory.

Comments 3.4 & 3.5

Comment 3.4. [Placeholder.] The rationale for a key design choice appears in the wrong section (literature review instead of methodology). Please relocate and expand.

Comment 3.5. [Placeholder.] The paper's contributions are listed inside the related work section. Move them to the Introduction for clarity.

Author response

Regarding Comment 3.4. [Placeholder author response.] We agree. The full motivation now appears in Section III.B, where implementation details (prompt design, pipeline stages, weight mapping) are also provided.

Regarding Comment 3.5. [Placeholder author response.] We relocated the contribution list to the end of the Introduction, before the methodology section, per standard journal structure.

Changes in the manuscript**[Section I: Introduction (Contributions)]**

[Placeholder manuscript excerpt.] In this study, we make the following contributions:

1. **[Contribution 1 placeholder.]** Brief description of first contribution.
2. **[Contribution 2 placeholder.]** Brief description of second contribution.
3. **[Contribution 3 placeholder.]** Brief description of third contribution.

[Section III.B: Design Rationale]

[Placeholder manuscript excerpt.] We argue that auxiliary modules should evaluate data quality rather than serve as primary predictors, reducing leakage risk while leveraging external knowledge.

Highlighted Changes in the Revised Manuscript

See next page. Replace `tracked-changes-guide.pdf` with your `diff.pdf` from <https://latexdiff.web.app/> (original deletions and revisions are colour-coded).

Tracked Changes in the Revised Manuscript

Template placeholder

Review Response Template

This PDF is a **placeholder** for your manuscript's tracked-changes file. Replace it with the real `diff.pdf` after you generate `diff.tex`.

About LaTeX Different

LaTeX Different — Tracked Changes (<https://latexdiff.web.app/>) is a browser-only front-end for authors who need journal-style tracked changes without installing Perl or `latexdiff` locally.

- **Diff engine.** Powered by `latexdiff` (F. Tilmann, GPL-3.0) — compares two $\text{\LaTeX}$ files and marks up changes with `\DIFadd` / `\DIFdel`.
- **Runs locally.** Entirely in your browser via [wasm-latex-tools](#) and [WebPerl](#) — nothing is uploaded to a server.
- **UI.** Developed by Tan Jing Jie (<https://jingjietan.com>); source at <https://github.com/jingjie00/latexdiff-ui>.

How to generate tracked changes

1. Keep two versions of your manuscript (e.g. `main-old.tex` and `main-new.tex`).
2. Paste the **old** (submitted) source into the *Old* column, or drop the `.tex` file.
3. Paste the **new** (revised) source into the *New* column.
4. Adjust options if needed (`-type`, `-flatten`, math/figure markup, etc.).
5. Click **Generate**. The marked-up `diff.tex` appears in *Tracked Changes*.
6. Use **Preview** in the app: revised passages are highlighted in **blue**, and removed original text in **red** — before you compile a PDF.
7. Copy or download `diff.tex`, save it beside your figures and bibliography files.
8. Compile `diff.tex` (e.g. `latexmk -pdf diff.tex`).

Important: Compile `diff.tex`, not the unchanged `main.tex`. Only `diff.tex` contains `\DIFadd` / `\DIFdel` markup.

How changes are highlighted

latexdiff compares the **old** and **new** files. In the compiled PDF (and in the web app **Preview**):

- **Revised / added text** (`\DIFadd`) — shown in **blue** (default `UNDERLINE` and `CTRADITIONAL` styles).
- **Removed original text** (`\DIFdel`) — shown in **red** with strike-through or margin notes, depending on `-type`.

Example (as it appears after diffing):

The model uses a standard encoder and ~~cross-entropy training~~ Longformer encoder with prototypical fine-tuning and cross-entropy guidance.

Choose markup under **Options** on the web app (`CTRADITIONAL`, `UNDERLINE`, `CHANGEBAR`, etc.).

Why use it?

- **Privacy** — sources stay on your machine; no upload.
- **No install** — full latexdiff in the browser.
- **Live Preview** — blue/red highlighting in the editor before compiling.
- **True L^AT_EX diff** — understands commands, floats, citations, and math.
- **Multi-file projects** — `-flatten` inlines `\input` / `\include`.
- **Journal-ready PDF** — compile with `pdflatex` / `latexmk` and attach to your response letter.

Include in your response letter

In `main.tex`, replace:

```
\includepdf[pages=-]{tracked-changes-guide.pdf}
```

with your generated PDF, e.g. `diff.pdf`.
